

Dear Ernest, KADY died three years ago....KIRL is brand new, but has the same pattern and facilities. KIRL has no frequency tests, but we frequently operate during the experimental period.

Best of luck with D.X.

Thank you for your reception report of KIRL Radio, which has been compared with the daily operating logs and found to be substantially correct.

KIRL is a 5000 watt AM station on 1460 kHz, licensed to operate daytime and make certain unscheduled tests between midnight and dawn. Our programming is generally contemporary hit records and large selling hits of the past, together with local news and news from the ABC Contemporary Network.

Equipment at KIRL is from many various companies, with a Collins 21E-1 transmitter into a two-tower directional antenna array. The directional pattern is not too much different than the circle of a non-directional station, except that the center has been shifted somewhat to the west.

KIRL is a new station in 1968, operating in the St. Louis suburb of St. Charles, Missouri. Our normal coverage is roughly the eastern half of Missouri and the southwest quarter of Illinois, although we have been heard on occasion on both coasts of the United States, Canada, and in several other foreign countries.

We appreciate and confirm your reception report, and regret that we do not have any regularly scheduled after-midnight frequency tests or the like, although we are frequently on the air during the testing period. Thank you for your interest in KIRL.

Very truly yours,

KIRL RADIO
