Dear Wayne:

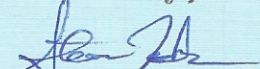

This letter confirms your reception of KGLO on October 26, 1988 at 7:21AM in Aurora on 1300kHz.

We received another DX report from the Denver area the very same morning. So propagation was definitely favoring the upper midwest into your QTH that morning.

KGLO operates full-time with 5kW, non-DA days, and 3 towers in line directional at night pointed toward the north. Nulls pointed toward Colorado Springs, Mississippi, and Grand Rapids, MI. The last several years we've received quite a few reports from Europe. But with the increase in sunspot activity the next several years, that will probably decline as propagation will favor the higher frequencies.

Thanks for the DX report and good DX-ing!

Sincerely,

Steve Locker
Asst Engineer
