Mr. Murray C. Mann
3702 South 17th
Omaha 8, Nebraska

Dear Mr. Mann:

Thank you very much for your reception report from Omaha. Your log checked quite closely with the station's log for that time period.

As you know, we operate on 570 kc. with an output power of one kilowatt. The transmitter is a Collins 20V-2, the speech equipment is of Gates manufacture, and the monitoring equipment is by General Radio. The antenna is a single 307' tower, with about 9.5 miles of ground wire.

About every week or two we conduct the after-midnight tests, one of which you picked up. These tests are for routine maintenance, but are unscheduled and of course unsponsored. They are run to determine any number of a variety of possible faults.

We have an application in for five kilowatts, but it will be several months before we know whether or not we will increase power.

Thanks again, and hope to hear from you again sometime.

Sincerely,

James L. Tonne, Ch. Engr.
