5 July 1977

Bill Nittler
603 W. 1st
McCook NE 69001

Dear Bill,

I am pleased to be able to verify your reception of Z-93 on June 30, 1977. Your reception was most likely the result of double-hop F2 propagation which occurs with some regularity in the early spring but rarely under the hot, dry conditions we have been experiencing.

Z-93 operates on 92.9 MHz with an effective radiated power of 100 kw vertical and horizontal. Our transmitter is an 830 series Collins with two finals each delivering 8.4 kw into two 12 element antennas (one vertical and one horizontal) 530 feet above average terrain.

Thank you for your report.

73,
