May 14, 1975

Dear Mr. Ernest J. Wesolowski,

The report you sent us on the May 13, 1975 reception of KATE was correct except for the commercial. "Strength for the Day" lasts untill about 5:15.

Our filaments are left on all night, so the tubes are essentially warm at sign on. Local sunrise occurs at approximately 5:45 am. However it starts getting light at 5:00. The suns rays at this time will start to disturb the atmosphere, causing the fading that you describe.

Very truly,

Gary Hoff, Chief Engineer
