Dear Mr. Thomas:

Thanks for the signal report from your area. At the time I was doing a special DX test for the National Radio Club. At the time of your reception I was running 250 Watts, after just switching from 84 Watts.

Our tower is a 151' quarter wave series fed radiator. We put out a very good signal because we are located on an island. Your report is verified at 3:32 a.m. EST on 1550 kHz. If your interested I will be running another DX test on February 28th from 2 a.m. to 4 a.m. with 84 Watts for the first hour, and 250 Watts for the final hour.

Thanks Again

Sincerely,

Richard M. Preston

Chief Engineer
